

Chemical Exposure Incidents at Mombasa Depot Need Urgent Review

Mombasa Depot · Operations, Logistics & Utilities · Issued by the HSE Analytics Team

What We Found

Between January and June 2026, Mombasa Depot recorded 12 Chemical Exposure incidents — more than double the average of our other six depot sites. What makes this urgent is not just the count: 8 of these 12 incidents — two out of every three — were flagged as having the potential for a serious injury or fatality. Across the rest of our network, that share is far lower. This is not a volume story. Something specific to how chemical exposure risk is being managed at Mombasa needs attention now.

What We're Asking You To Do This Week

- Verify critical controls today. Site supervisors, please confirm that ventilation, containment, and PPE controls for chemical handling areas at Mombasa are in place and functioning — not just documented as complete.
- Report any exposure event, even a minor one. A brief exposure that seems minor today is exactly the pattern behind our most serious incidents this year. Use the usual incident line — we would rather hear about ten near-misses than one more serious event.
- Confirm your PPE is rated for the chemicals you're handling. Standard-issue gloves and respirators are not interchangeable across every product — check with your supervisor if you are unsure what's required for your specific task.
- Attend the toolbox talk this Friday. A short session at shift handover will walk through what we're seeing at Mombasa and what's changing in chemical handling procedures going forward.

We know the Operations, Logistics, and Utilities teams at Mombasa are managing a heavy workload under real time pressure. This alert isn't about blame — it's about making sure everyone handling chemicals at that depot goes home the same way they came in. Thank you

for taking this seriously.
